

Magna Fab Inc. is an oilfield equipment manufacturing company that builds and tests high pressure pipe.

The HUWE was introduced to Magna Fab in 2011, when we were asked to be the test facility for the new product. We used the HUWE for all high pressure pipe pressure testing that was being done in our shop. We soon realized that by using the HUWE instead of sledge hammers, to assemble or disassemble unions, the hammer unions that were purchased for the job were leaving our shop still looking brand new.

We have pressure tested 3000, 5000 and 15000 psi piping and have not had to use a sledge hammer to assemble or disassemble unions since the HUWE was designed.

Our safety people have seen fewer "near miss reports" and the shop hands experience less fatigue because they have not had to use sledge hammers to hammer unions all day. Magna Fab has seen also a reduction in insurance premiums because of fewer accidents.
